- What if we can't guess the factorization?
- Use the formulas for x_1, x_2.

$$\begin{aligned} x_1, x_2 &= \frac{-b\pm\sqrt{b^2-4ac}}{2a} = \frac{-8\pm\sqrt{8^2-4\cdot 3\cdot(-11)}}{2\cdot 3} \\ &= \frac{-8\pm\sqrt{64+132}}{6} = \frac{-8\pm\sqrt{196}}{6} \\ &= \frac{-8\pm 14}{6} = \begin{cases} \frac{-8+14}{6} = \frac{6}{6} = 1 \\ \frac{-8-14}{6} = -\frac{22}{6} = -\frac{11}{3} \end{cases} \end{aligned}$$

$ax^2 + bx + c = a(x - x_1)(x - x_2)$, where $x_1, x_2 = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$.

Example

$$\begin{aligned} x_1, x_2 &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-8 \pm \sqrt{8^2 - 4 \cdot 3 \cdot (-11)}}{2 \cdot 3} \\ &= \frac{-8 \pm \sqrt{64 + 132}}{6} = \frac{-8 \pm \sqrt{196}}{6} \\ &= \frac{-8 \pm 14}{6} = \begin{cases} \frac{-8 + 14}{6} = \frac{6}{6} = 1 \\ \frac{-8 - 14}{6} = -\frac{22}{6} = -\frac{11}{3} \end{cases} \end{aligned}$$
