Linear substitutions to simplify radicals $\sqrt{ay^2+by+c}$

- Using linear substitutions, radicals of form $\sqrt{ay^2+by+c}$, $a \neq 0$, $b^2-4ac \neq 0$ can be transformed to (multiple of):
  - $\sqrt{x^2+1}$
  - $\sqrt{-x^2+1}$
  - $\sqrt{x^2-1}$.
- We already studied how to do that using completing the square when dealing with rational functions.

$$\begin{aligned} \mathrm{d}x &= \mathrm{d}\left(-1 + \frac{2}{1-t^2}\right) \\ &= \frac{4t}{(1-t^2)^2}\mathrm{d}t \end{aligned}$$

Euler substitution $x = \sec\theta$, $\theta = 2\arctan t$

- $x = \sec\theta$ transforms $\mathrm{d}x, x, \sqrt{x^2-1}$ to trig form.
- $\theta = 2\arctan t,\ \ t \in (-\infty, -1) \cup [0, 1)$ rationalizes $\mathrm{d}\theta, \cos\theta, \sin\theta$.

What if we compose the above? We get the Euler substitution:

$$x = -1 + \frac{2}{1-t^2}$$

$$\sqrt{x^2-1} = \frac{2t}{1-t^2}$$

$$t = \pm\sqrt{\frac{x-1}{x+1}}$$

$$\begin{aligned} \mathrm{d}x &= \mathrm{d}\left(-1 + \frac{2}{1-t^2}\right) \\ &= \frac{4t}{(1-t^2)^2}\mathrm{d}t \end{aligned}$$

Definition

The Euler substitution for $\sqrt{x^2-1}$ corresponding to $x = \sec\theta$ is given by:

$$
\begin{aligned}
x &= \frac{1+t^2}{1-t^2}, \qquad\qquad t \in (-\infty, -1) \cup [0, 1)\\
\sqrt{x^2-1} &= \frac{2t}{1-t^2}\\
\mathrm{d}x &= \frac{4t}{(1-t^2)^2}\mathrm{d}t\\
t &= \pm\frac{\sqrt{x^2-1}}{x+1} \quad .
\end{aligned}
$$

Rationalizing Substitutions

Some non-rational fractions can be changed into rational fractions by means of appropriate substitutions. In particular, when an integrand contains an expression of the form $\sqrt[n]{g(x)}$, the substitution $u = \sqrt[n]{g(x)}$ may be effective.

Example

$$\int \frac{\sqrt{x+4}}{x} \mathrm{d}x$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x + 4$, so $x = \textbf{?}$ and $\mathrm{d}x = \textbf{?}$.

$$\int \frac{\sqrt{x+4}}{x}\mathrm{d}x = \int \frac{\textbf{?}}{\textbf{?}}\textbf{?}$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x + 4$, so $x = \textbf{?}$ and $\mathrm{d}x = \textbf{?}$.

$$\int \frac{\sqrt{x+4}}{x}\mathrm{d}x = \int \frac{u}{\textbf{?}}\textbf{?}$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x+4$, so $x = \textbf{?}$ and $\mathrm{d}x = \textbf{?}$.

$$\int \frac{\sqrt{x+4}}{x}\mathrm{d}x = \int \frac{u}{\textbf{?}}\textbf{?}$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x + 4$, so $x = u^2 - 4$ and $\mathrm{d}x =$ **?** .

$$\int \frac{\sqrt{x+4}}{x}\mathrm{d}x = \int \frac{u}{u^2-4}\textbf{?}$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x + 4$, so $x = u^2 - 4$ and $dx = \textbf{?}$.

$$\int \frac{\sqrt{x+4}}{x} dx = \int \frac{u}{u^2 - 4} \textbf{?}$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x + 4$, so $x = u^2 - 4$ and $\mathrm{d}x = 2u\mathrm{d}u$.

$$\int \frac{\sqrt{x+4}}{x}\mathrm{d}x = \int \frac{u}{u^2-4} 2u\mathrm{d}u$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x + 4$, so $x = u^2 - 4$ and $\mathrm{d}x = 2u\mathrm{d}u$.

$$\begin{aligned}\int \frac{\sqrt{x+4}}{x}\mathrm{d}x &= \int \frac{u}{u^2-4} 2u\mathrm{d}u\\ &= 2\int \frac{u^2}{u^2-4}\mathrm{d}u\end{aligned}$$

Example

Let $u = \sqrt{x+4}$. Then $u^2 = x + 4$, so $x = u^2 - 4$ and $\mathrm{d}x = 2u\mathrm{d}u$.

$$\begin{aligned}

&= 2\int \left(1 + \frac{4}{u^2-4}\right)\mathrm{d}u && \Big|\ \text{long division}
\end{aligned}$$

Example

$$\begin{aligned}
